1 Behavioural sensitivity
rerun saved nights under other patience shapes, Lyft delays
2 Five-van feasibility
run the 168-request evening; check solve times, candidate limits
3 Agreed evaluation criteria
price one more rider reached per Lyft order; paired intervals
4 Baseline, then threshold search
matched-budget baseline; tune on some nights, report on fresh
In parallel, from step 2: dispatcher benchmark, rolling-horizon MILP vs greedy insertion, across fleet size, demand pattern and re-planning interval
